## New New Math

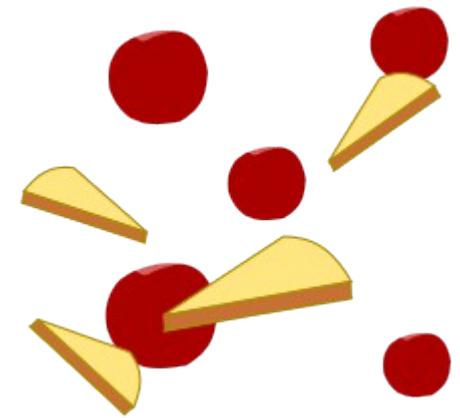

Viva Kittery's very own scientific reporter Stilson Kreger, is reporting on a fundamental reversal of long accepted math thinking and portrayal of symbols.

First, Stilson has some announcements and discoveries he read in a journal called "Scientific Stuff"...

First of all, some old and accepted configurations are being cast away Stilson reports. Shapes such as triangles, circles, squares , tetrahedrons, "gorfnile shapes",.. ( shapes created by linear code writing).. parallel lines and actually points of reference defined by a dot... all being cast away... turns out that the universe isn't perfect and subsequently fitting natural shapes into perfect forms actually isn't possible Stilson revealed. He remarked I'm reading all this right now in this magazine called "Scientific Stuff"!!!

So interesting items are now being sought to replace the perfect forms we have lived and relied on for so long!

The circle is being replaced with an apple, the triangle by a piece of pie, the square is by a tree with ( x \_ fn) carved in it, and finally straight lines of any kind used in part or whole to provide a math symbol or in truncated form such as the = sign are being replaced with "white noise" ... pictorially looking like a fuzzy TV picture!

Stilson remarked as he was reading... this is fundamentally unforgivable he laughed.

A world with no perfect representations filled with creations that can only be seen as perfect from very long distances! Like very long distances... that even then cant be annotated as a single point because that's been cast away too.

Perhaps Stilson said..perhaps this is why we have language after all, and why its better to paint a picture than speak a thousand words, ... and perhaps then, even better to read a very short story rather a very long book..

Viva Kittery!! Stilson yelled..
